Big Vision

BVB2000 SERIES

Ophthalmic Optical Biometer

Not a simple biometer

But a **Biometer + OCT** 2 in 1 device

www.bigvisiontech.com

生物测量仪，让眼部数据测量更智能精准

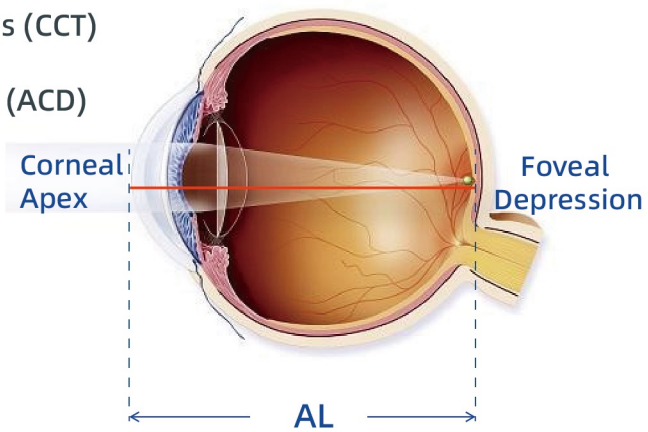

BigVision BVB2000 is

An artificial intelligent ophthalmic optical biometric instrument
Designed based on OCT domain technology

It is a new second-generation biometric instrument+OCT equipment 2 in 1

1-click measurement, 12 acurate optometric parameters

- Axial Length (AL)
- K1、K2
- Axis (AX)
- AL/CR
- Pupil Diameter (PD)
- WTW
- Central Corneal Thickness (CCT)
- Anterior Chamber Depth (ACD)
- Lens Thickness (LT)
- Vitreous Length (VL)
- Retinal Thickness (RT)
- Choroidal Thickness (CT)

One click fully automatic measurement, simple and efficient

Automatic pupil localization

Intelligent three-dimensional platform, automatic adjustment of jaw rest, working distance, automatic switching between left and right eyes

Rapid measurement

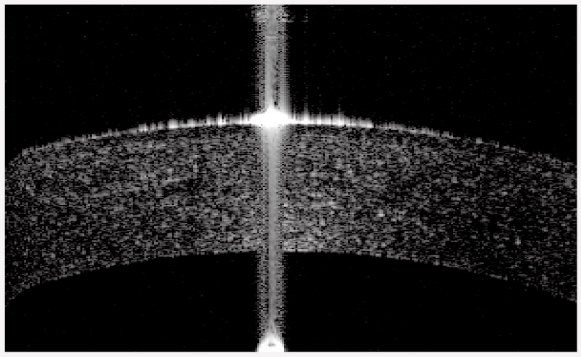

Autofocus, auto-acquisition, rapid acquisition of multiple optometric parameters in both eyes within 60S

Voice Guidance

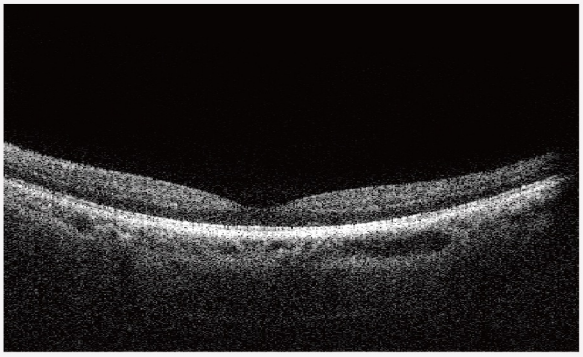

Intelligent voice guidance, smooth operation, good user experience

Visible measurements, Precise and reliable

Real time dynamic display of OCT corneal images, retinal choroidal images, accurate positioning, ensure the reliability and accuracy of measurement data.

A diagram of the structure of the cornea

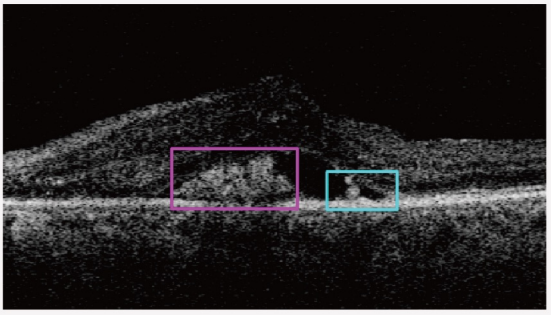

Al diagnosis: no obvious abnormality

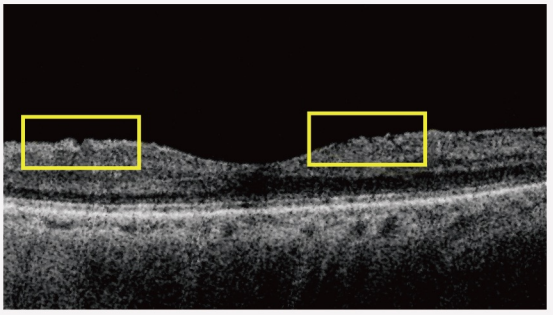

A diagram of the structure of the fundus

Retinal funduscopy, early detection of lesions

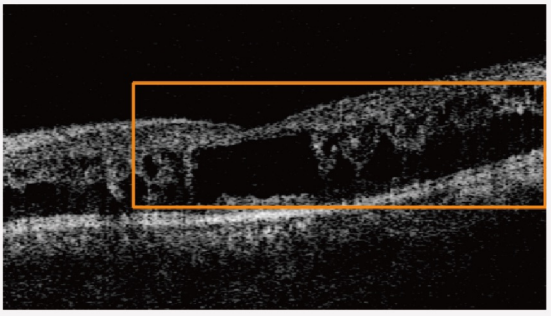

The fundus macular OCT image can clearly show: retinal splitting, macular hole, macular edema, macular epiretinal membrane, retinal hemorrhage, subretinal effusion, retinal detachment and other lesions.

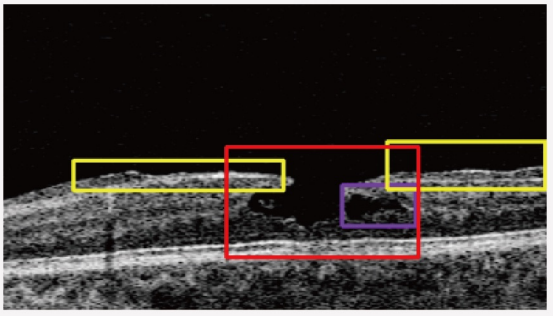

■ Choroidal neovascularization

■ Epiretinal membrane

■ Retinoschisis

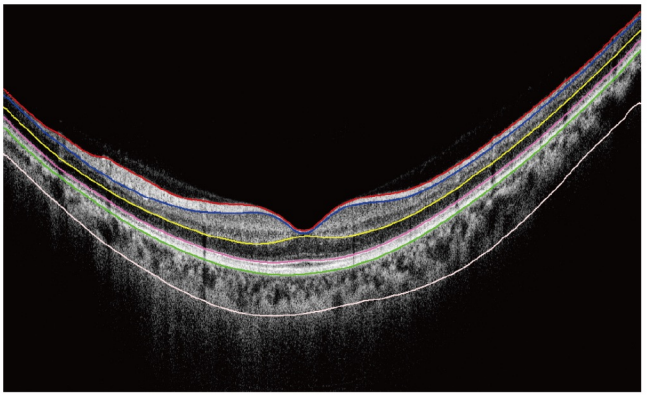

■ Macular hole

Choroidal thickness, monitoring myopia progression

The choroid shifts the optical plane back and forth through changes in its own thickness, thus affecting changes in the refractive error of the eye.

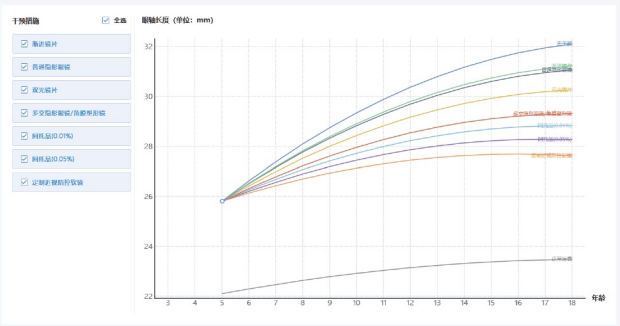

Continuous detection of retinal thickness, choroidal thickness, myopia development and correction effect!

Myopia risk prediction, twice the result with half the effort in patient education

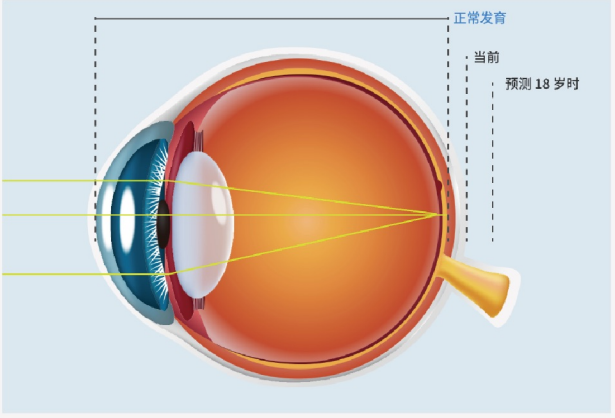

Prediction of Myopia

- Predicting ocular axis development, refractive development by age 18 years
- Comparing the developmental predictions

Simulation of Vision

- Simulates the effect of different diopters with different clarity of vision
- Simulates the growth and development of the eye axis as it gradually lengthens

Technical parameters

Gan Machinery Note: 20242160119

Axial Length

Measuring range	11.50~39.00mm
Display accuracy	0.001mm
Difference tolerance	±0.1mm
Repeatability	±0.033mm

Central Corneal Thickness

Measuring range	0.22~1.50mm
Display accuracy	0.001mm
Difference tolerance	±0.05mm

Radius of corneal curvature

Measuring range	4.00~12.00mm
Display accuracy	0.001mm
Difference tolerance	±0.05mm

Astigmatic axial position

Measuring range	0°~180°
Display accuracy	1°
Difference tolerance	Meridian radius difference 0.3mm Measurement Tolerance ±4° Meridian radius difference >0.3mm, Measurement tolerance ±2°

White to white distance

Measuring range	6.00~16.00mm
Display accuracy	0.001mm
Difference tolerance	±0.1mm

Pupil diameter

Measuring range	0.50~13.50mm
Display accuracy	0.001mm
Difference tolerance	±0.1mm

Anterior chamber depth

Measuring range	0.52~6.00mm
Display accuracy	0.001mm
Difference tolerance	±0.05mm

Lens thickness

Measuring range	3.00~6.00mm
Display accuracy	0.001mm
Difference tolerance	±0.05mm

Other parameters

Scanning frequency	⩾18.5kHz
Scanning range of the posterior segment	⩾5mm
Imaging depth	⩾2.2mm
Vertical resolution	⩽5um
Laser wavelength	840nm±20nm
Average laser power at eye level	⩽730μW
Display	23.8-inch color LCD screen
Processor	Main frequency 2.70GHz
